ACKNOWLEDGEMENTS

I would like to thank my children, Ameche, Beluchi, and Chidi for foregoing my full attention while I was immersed in pursuit of this goal; it was love of these boys and desire to lead by example that kept me going.

My sincere thanks to Ms. Alison Glass, for her invaluable advice and tireless desire to help even when I stumbled, Barbara Webster for directing me to the wealth of Texas Education Agency data, my students Ivette Garcia, Makini Francis, and Corey Akst who urged me on and were willing to help in whatever way they could to see me accomplish this objective.

I wish to express my deepest gratitude to Dr. Yongmei Lu (Committee Chair) for her guidance, insistence on excellence and most importantly for sparing some time from her son, Jeffrey, who was born at the inception of this research. There is no word to express my gratitude to Dr. Richard Boehm, and Dr. Giordano, members of my dream committee for taking me under their wings and helping me soar.

This manuscript was submitted on August 1, 2006.

CHAPTER I

INTRODUCTION

It is a widely held assumption that school violence is concentrated in large, inner city, and urban school districts. This generalization is very likely related to hundreds of reports, both scholarly and in the news media, of the relationship between crime and juvenile delinquency and high rates of poverty, broken families, crowded living conditions, and the lack of economic opportunity. High rates of crime and delinquency and recidivism are spatially linked to inner city ghettos and barrios and are very likely to show up in inner city schools.

The Columbine High School shootings that occurred on April 20, 1999, drew attention away from inner city schools to violent acts in suburban and even rural schools. The socio-economic profiles of the two students who killed one teacher and 14 students included, White, affluent, suburban schooling, and a lack of any previous record of serious misconduct (Donohue, Schiraldi, and Zeidenberg 2000). In Texas in 1998, two students died, allegedly of a cocaine overdose, and about 50 students were arrested of heroin distribution on a high school campus in a wealthy suburb. An Austin American Statesman article (Easton 1998) reported these arrests and pointed out continued drug and alcohol violations in an affluent north Texas community.

This shift in notoriety from inner city schools to suburban and rural districts has created a need for scientific researches into the “where?” of school violence, and to a

limited extent, the “why?” This thesis study aims at examining where the school violence incidents are in the State of Texas. Are there more violence incidents in urban school districts or suburban and rural school districts? Further, the study explores the reason that certain school districts have more school violence incidences than others.

Geographic information science (GIS) software will be used to map the incidences of school violence in Texas school districts. Such software has been documented by the United States Department of Justice (2005) as an accurate and widely used method of analyzing crime and delinquency. GIS will be used to map the distribution of school violence in Texas to answer the “where?” question. The data for this analysis will come from the Texas Education Agency (TEA), the best source, despite some difficulties in securing universal data because of juvenile privacy issues.

Once the distribution of school violence has been mapped and analyzed, it will be possible to identify where certain “kinds” of school violence have taken place. By “kinds” this researcher means the difference between misdemeanor offenses and felony offenses. It will then be possible, using statistical techniques, to relate the distribution of school district violence to key school district characteristics such as grade level, ethnicity, and gender. Once this is accomplished it will be possible to make certain policy recommendations for the sensible control and prevention of school violence in Texas.

Statement of the Problem

Common sense suggests that large urban schools account for most of the severe violence in primary and secondary schools today, perhaps, due to scholarly and news media reports of the relationship of crime to poverty, divorce, poor living conditions, and low socio-economic level. However, every now and then serious crimes occur in rural and often suburban schools. Across United States fatal incidences of shooting have been

reported in rural school district (Donohue, Schiraldi and Zeidenberg 2000). Those incidences led to the following questions, which are the subject of this research.

Are there spatial clusters or patterns of serious (felony) violence in suburban and rural school districts in Texas public school districts? How do urban school districts compare to non-urban school districts in terms of the geographical distribution of school violence? What are the social and demographic variables that have strong relationship with school violence in a school district?

The Sub-Problems

SUB-PROBLEM #1: Is gender related to the rate of school violence in Texas public school district?

SUB-PROBLEM #2: Is race or ethnicity related to the rate of school violence in a district?

SUB-PROBLEM #3: Is grade level related to the rate of school violence in Texas public school district?

SUB-PROBLEM #4: Do urban or non-urban school districts exhibit clusters of felony school violence?

SUB-PROBLEM #5: Do urban or non-urban school districts exhibit clusters of misdemeanor school violence?

CHAPTER II

NATURE AND SCOPE OF RESEARCH

Definition of Terms

Certain terms will be frequently used throughout this paper. The following are the definitions of these descriptive terms:

Rural School District: These are school districts in such places defined as rural by the United States Census Bureau. The Census Bureau's classification of "rural" consists of all territory, population, and housing units located outside of urbanized area (UA) or an urban cluster (UC). The rural component contains both place and non-place territory. Geographic entities, such as census tracts, counties, metropolitan areas, and the territory outside metropolitan areas, often are "split" between urban and rural territory, and the population and housing units they contain often are partly classified as urban and partly classified as rural (U.S. Census Bureau 2002).

Urban School District: These are school districts in such places defined as urban by the United States Census Bureau. For Census 2000, the Census Bureau classifies as "urban" all territory, population, and housing units located within an urbanized area (UA) or an urban cluster (UC). It delineates UA and UC boundaries to encompass densely settled territory, which consists of: core census block groups or blocks that have a population density of at least 1,000 people per square mile and surrounding census blocks that have an overall density of at least 500 people per square

mile. In addition, under certain conditions, less densely settled territory might be part of each UA or UC (U.S. Census Bureau 2002).

Suburban School District: These are school districts in places that did not meet any of the definitions stated above, generally found in the area between urban and rural territory.

Non-Urban School District: These are school districts classified as rural and those classified as suburban combined, see the definitions of urban and suburban above.

Felony: A crime more serious than a misdemeanor, carrying a penalty of more than one year in prison (The Law Encyclopedia.com 2004). Some examples include murder, suicide, rape or sexual battery, robbery, or physical attack with a weapon.

Misdemeanor: An offense usually punishable by fine or a year or less in prison (The Law Encyclopedia.com 2004).

School Violence: Any crime, misdemeanor and felony alike, which took place on school property irrespective of who perpetrated it on whom.

Prevention: This is the foundation laid to deter crime and violence. It consists of the groundwork laid to prevent crime from occurring in the first place.

Intervention: Stepping in when crime or violence is likely, and stopping it before it becomes a serious matter.

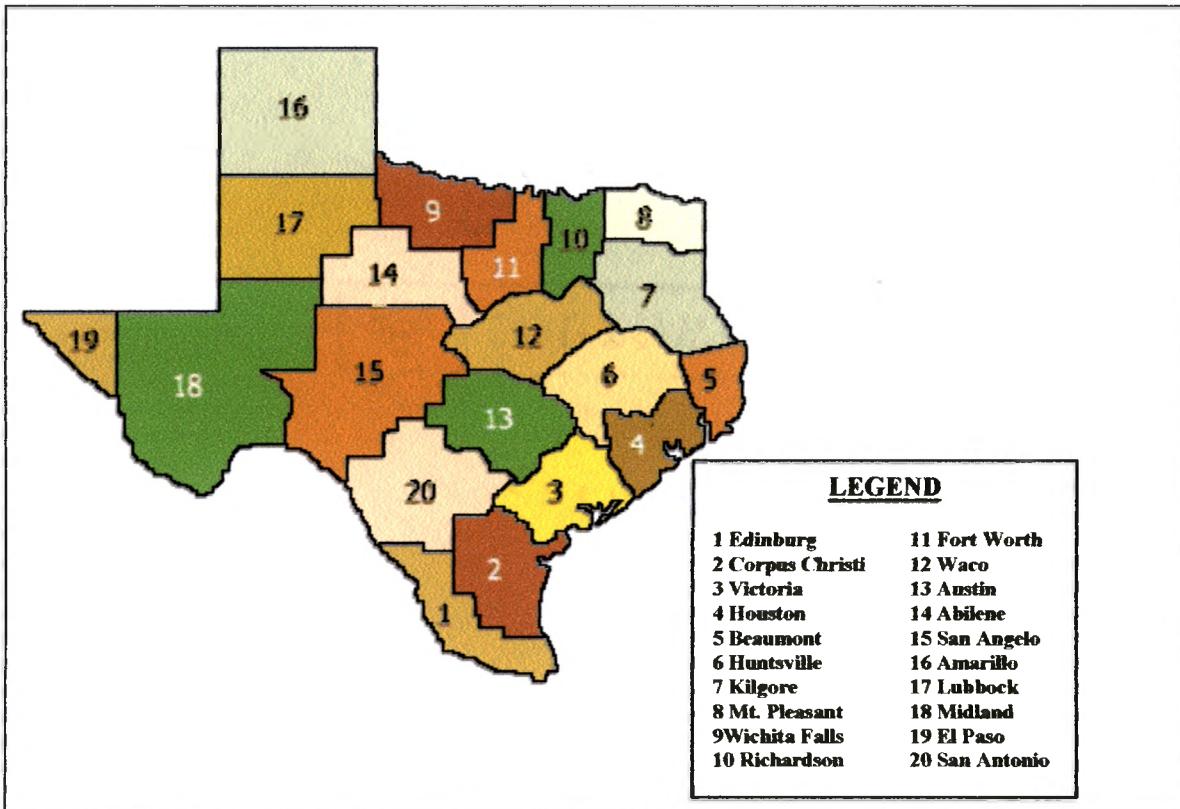

Enforcement: This is consciously, consistently and uniformly enforcing school rules, administering punishment as applicable, and helping children who have disobeyed the rules learn how to alter their behavior.

Child: This means anyone currently enrolled and receiving instructions in grade K-12.

Limitations of the Study

1. The study area is the State of Texas, while the focus of the analysis is the aggregate incidences of school violence in the Texas public school districts. Texas is one of the few states requiring school districts to report school violence to a central location, in this case, the Texas Education Agency.
2. In this analysis, school violence refers to all misdemeanor and felony crimes that occur on school property.
3. This analysis is not going to delve into crimes in private or parochial schools. There was not enough reliable information on such school districts. These schools were not required to file violence reports with the Texas Education Agency.
4. The demographics for this research included two distinctive groups of school districts in twenty geographic regions of the Texas educational services centers as shown in Figure 1 below obtained from Texas School District Locator Page.
5. This analysis used data at the school district level since individual school data were not available.

Figure 1. Education Services Centers (ESCs).

*For maps of Counties and Districts in each ESC Region, visit the Texas School District Locator Page.
<http://deleon.tea.state.tx.us/SDL/SDLdownload.asp>

Delimitations of the Study

- Episodes of violent crimes totaling less than five cases were not released by the Texas Education Agency.

Research Questions

1. Where are misdemeanors Hotspots?
2. Where are felonies Hot Spots?
3. Are there clusters of misdemeanors in urban school districts?
4. Are there clusters of misdemeanors in non-urban school districts?
5. Are there clusters of felony violations in urban school districts?
6. Are there clusters of felony violations in non-urban school districts?
7. What is the relationship between ethnicity and school violence?
8. What is the relationship between grade-level and school violence?
9. What is the relationship between gender and school violence?

Hypothesis

1. There is no cluster of misdemeanors in urban school districts.
2. There is no cluster of misdemeanors in non-urban school districts.
3. There is no cluster of felony violations in urban school districts.
4. There is no cluster of felony violations in non-urban school districts.
5. There is no relationship between ethnicity and school violence.
6. There is no relationship between grade-level and school violence.
7. There is no relationship between gender and school violence.

Assumptions

The following assumptions will be made for the purpose of this study:

There is a uniform enforcement of the safe school Act among all Texas school districts.

- All assignments to Disciplinary Alternative Education Programs (DAEP) have been reported accurately and promptly to the Texas Education Agency.

Significance

Researchers have tried unsuccessfully to predict potential areas of serious high school violence. All the school shootings have been in non-urban communities (Donohue, Schiraldi, and Zeidenberg 1998). Until recently, school violence data were not available for crimes committed at schools and researchers had to rely on uniform crime report data, which reported arrests by age of person arrested (Texas Education Agency, Policy Research 1994). However, the data did not discriminate the location of the arrest making it difficult to measure violence on school campuses since school age children may not necessarily be enrolled at any school at the time of their arrest. In 1995, Texas 74th Legislature made it possible for school administrators to collect student level violence data and report back to Texas Education Agency (TEA) (Shirley 2005 p. 51).

The findings of this study may encourage a more comprehensive study on school violence, which may influence the allocation of safe school funding. Federal Safe School initiatives were put in place to meet the America 2000 national education goal “six.” Goal “six” states that by the year 2000 every school in America will be free of drugs and violence and will offer a disciplined environment conducive to learning. Unfortunately, it is year 2006 and this goal is yet to be achieved particularly when some school administrators refuse to report school violence in their school district (New York Times 2003).

This research may serve as an impetus for additional investigations into school violence, which may in turn alert the department of public safety to rethink how their resources are employed. “The police department in Abington, Pennsylvania was able to magnify its presence in the community without hiring additional officers” (Muller 2005 p.1). Mapping school violence will also help to identify the source of school violence and disrupt it before it happens (Crowe 2000; Hirschfield, Bowers and Yarwood 2001).

Parents of school age children will be able to make informed decision when moving to a particular school district. They will be equipped with a visual aid of school violence incidents and their geographical distribution.

To the academic world, bringing spatial dimension to school violence analysis will be a huge contribution to the research knowledge and hopefully a catalyst for numerous researches of this nature in the future.

CHAPTER III

LITERATURE REVIEW

An understanding of juvenile delinquency and school violence will be enhanced immensely with an overview of social cognitive theory. Four widely accepted cognitive theories that have been applied in understanding juvenile delinquency including school violence discussed here are: Albert Bandura's (1963) social cultural theory, Sutherland's (1924) theory of differential association, Matza's (1957) neutralization theory, and Akers' (1968) differential reinforcement theory.

Social cognitive theory has its roots in social learning theory, such as that of the concept of social self (James 1890), and the shift from self to the process between individuals (Lewin 1951). On the other hand, contemporary social learning positions include self originated change versus change emanating from interaction with others (Rotter 1954), and emphasis on cognition (Bandura and Walters 1963). Regardless of the theorist, social cognitive theories have these fundamental premises in common: (1) learning can occur by observation, (2) people have a tendency to emulate other people they admire, and (3) rewards or punishment may induce a repeat performance of a behavior in a given situation (Stone 1998). Social cognitive theory (Stone 1998) began officially with the publication of Albert Bandura's book, *Social Foundations of Thought and Action: A Social Cognitive Theory* (1986). It was further influenced, in terms of cognitive perspective, by George Kelly's personal constructs theory (1955). Kelly posited

that how a person thinks about the world shapes his or her personality and behavior (1955). To understand how much influence Kelly had on social cognition theory, compare the quote below to Bandura's (1977) self-efficacy concept. Self-efficacy is ones ability to perform certain acts or behavior based on ones beliefs and motivation.

Man looks at his world through transparent templates, which he creates and then attempts to fit over the realities of which the world is composed. Constructs are used for predictions of things to come, and the world keeps on rolling on and revealing these predictions to be either correct or misleading. This fact provides the basis for the revision of constructs and, eventually, of whole constructs science. (Kelly 1955, 8 & 14)

Social cognition theory accounted for human behavior as complex interactions of personal factors, behavior, and environmental factors (Glanz, Rimer, and Lewis 2002). The environment consists of social (family members, friends, colleagues, etc.) and physical (room size, temperature of the surrounding area, presence of food, etc.) environment (Neill 2003). The constant reciprocal influences of behavior, environment, and people on one another are termed *reciprocal determinism* (Bandura 1978). Other constructs of this theory are observational learning, self-regulation, and self-efficacy (Bandura 1978; 1986; 1989). Observational learning means learning can occur by modeling and by imitation (Huitt 1999). It allows people to acquire new behaviors without having to undergo trial and error (Pajares 2002). Self-regulation represents people's ability to set goals, observe and monitor themselves, judge and evaluate, and be happy or angry with themselves (Huitt 1999). Self-efficacy is ones' confidence in

carrying out a specific behavior (Bandura 1978; 1986; 1989). The implication of self-efficacy is that people's beliefs determine their level of motivation, actions and affective state than objective reality (Bandura 1997). Factors such as social persuasions, modeling experiences, mastery experiences and physiological states affect ones self-efficacy (Bandura 1977).

Bandura's work was accepted in criminology community, partly due to his stages of modeling: attend, retain, rehearse and perform, which did away with the assumption of external rewards and punishment given that learning can take place without them and because of the differential association theory prevalent in the 1930s (O'Connor 2005).

Sutherland's (1924) theory of differential association proposed a nine-point theory listed below: (1) Criminal behavior is learned, (2) Criminal behavior is learned during communication by interacting with others, (3) Criminal behavior occurs among friends, peers, and most intimate personal companions, (4) Criminal behavior involves learning the techniques, motives, drives, rationalizations, and attitudes, (5) Motives and attitudes are learned from defining legal codes as favorable or unfavorable, (6) To become a criminal, there is an excess of definitions favorable to violation of law over definitions unfavorable to violation of law (differential association), (7) Differential associations vary in frequency, duration, priority, and intensity, (8) Criminal behavior is learned in the same manner as in any other learning and (9) Criminals must be differentiated from non-criminals. The critiques of differential association theory point to research problem of determining whether delinquency come before delinquent friends or vice-a-vise. Differential association does not explain the origin of first unfavorable definition and said nothing about spontaneous, willful acts.

Differential association continued to be applied to crimes such as juvenile, adult, upper world and underworld until neutralization theory (Sykes and Matza 1957), which assumes that criminals develop and use rhetoric or vocabularies to surmount normative attacks of the social world and justify deviant behavior (Gordon 2005). This theory contends that people learn the values, attitudes, and techniques of criminal behavior through subterranean values, which exist side by side with conventional values (O'Connor 2005). Sykes and Matza (1957) identified the following five techniques of neutralization: (1) Denial of responsibility, (2) Denial of injury, (3) Denial of victim, (4) Condemning the condemners and (5) Appeal to higher loyalties. While this theory did not displace differential association, it accounted for occasional criminal behavior such as shoplifting.

Another attempt to modify differential association came with the advancement of differential reinforcement theories (Burgess and Akers 1968). Akers' differential reinforcement theory combines Skinner's (1953) operant conditioning, with Bandura's (1963) observational learning and Sutherland (1924) differential association theories. Akers (1985) contends that the same mechanism involved in learning acceptable behavior is also applicable in deviant behavior and that differential association, differential reinforcement and cognitive definitions among others, influence social behavior. This theory has been used to explain the differences between users and abstainers among teenagers involved in tobacco, drug, and alcohol use (Akers et al. 1979). Differential reinforcement explains what it takes to develop the motivation, attitudes, and techniques necessary to engage in deviant behavior (Gordon 2005).

The above theories will not only increase an understanding of school violence but also guide this research in recommending steps for combating violence. Social cognitive theory has been demonstrated to be effective in reducing alcohol use among some high school students (Glanz, Rimer and Lewis 2002). It could be applied in schools by changing the social and physical environment and children's perception of classroom or situation (Glanz, Rimer and Lewis 2002). Situation is individual's perception of immediate environment (Stone 1998). Its methods are still being used in interventions such as (1) modeling, (2) skill training (reasoning) - psycho motor and social skills (refusal skills) - behavioral rehearsal, (3) self-monitoring - a contract with oneself, and (4) contracting - contracting with others; a reward may be involved; specific behaviors; goals; and signatures. Teachers can use social cognition based strategy to improve learning and confidence of their students. Teachers can improve students' emotional states, wrong perceptions and way of thinking (individual factors), skills and goal setting (behavior) and changing classroom elements (environmental factors) by modeling desired behavior (Pajares 2002). An understanding of the above theories will enable this research to make effective but practical recommendations for combating school violence later.

Cartography and crime mapping is not new to law enforcement agencies. Law enforcement agencies literally used pushpins to mark all crime incidences on hardcopy maps. This became cumbersome if not overbearing. They also collected data stored in the form of database information including the addresses. The United States Department of Justice and various police departments have been mapping crime for years but as the information got voluminous, there has been a shift to computer applications. One of these shifts is toward the use of GIS in mapping crime. It is important to note that the advent

of the computer did not change the cartographic approach to crime; instead, X-Y coordinates are added to the data already existing in police offices. In cases where only the street address is known geocoding service is used to match addresses to the street block, ZIP Code, or census-tract to respect the privacy law (Stoe 2002). Many police departments across the nation are using some customized extension to ESRI's or other form of GIS software packages to map crime in their various jurisdictions. One of these customized tools in use today is the "Community Police Beat Book" developed by the ESRI. Crime mapping enables the Pennsylvania police department to increase its services in the community without needing to recruit extra officers (Mueller 2005).

The most common types of maps produced by law enforcement agencies and the National Institute of Justice are Pin Maps, Thematic Maps, and Integrated or Associated Maps. Pin Maps are traditional pushpin maps that are now done on GIS. Geographic Information Science makes it easier to create, update, duplicate, and distribute these maps more proficiently (Muller 2005). Thematic maps use shading ranges from light to dark (the lightest shade stands for the lowest value and the darkest shade stands for the highest value) to identify the density value of a particular attribute, namely the number of crime incident on a particular neighborhood. Integrated or Associated maps are a combination of pin map and thematic maps used to spatially put data in context. The rapid advancement of technology, computer-based techniques for exploring, visualizing, and explaining the incidences of criminal activity have been helpful in crime analysis (Grubesic and Murray 2002). As Murray et al. (2001) noted, it is the ability to combine spatial information with other data that makes GIS so valuable. The United States Department of Justice (2005) noted that GIS and mapping software and desktop

computers now provide mapping and data analysis capabilities beyond what was possible with mainframe computers of the late 1980s and early 1990s, and are inexpensive and accessible for even small and budget-constrained police departments. The innovations demanded by community- and problem-oriented policing require that departments incorporate a geographic, spatial, or local focus, and emphasize the importance of integrating crime-mapping techniques into departmental management, analysis, and enforcement practices. Crime mapping provides law enforcement agencies with a powerful tool to aid in crime control and crime prevention efforts. GIS can help law enforcement agencies identify crime "hot spots" upon which to focus limited resources. More importantly, crime mapping can help law enforcement identify the underlying conditions that give rise to crime problems, as well as assess the effectiveness of responses to those problems.

An illustration of the application and power of GIS in crime mapping as published in 2003 CADALYST Magazine (2005) is presented below: a). "Hot Spots: In the episode entitled "Surveillance" from "The District," in order to identify where stolen vehicles will most likely be found, the fictional police chief and his staff use ArcView GIS and ArcView Spatial Analyst to study the locations where stolen cars equipped with LoJack devices have previously been recovered. b). Tactical Planning: PPD's fictional counterpart in "The District" also demonstrates the effectiveness of GIS as a tool for tactical planning in the episode "The Real Terrorist." "Facing possible terrorist attack, the fictional police chief used a network of roadblocks and checkpoints to create a containment area. The efficiency of the plan is tested beforehand with several different

scenarios simulated on GIS maps created in ArcView GIS and ArcView Network Analyst" (Wong 2003 p. 5).

Spatial statistic is the tool used in ArcGIS 9 for identifying spatial clusters of statistically significant high or low attribute values. It can identify area of high crime and also shows an area of high incidence of a specific crime, given a normalized data. "Given a set of weighted data points, such as the number of crimes per census block, and operating under the expectation that data values are randomly distributed across the study area, this tool delineates clusters of census blocks with higher than expected crime incidents" (Scott and Warmerdam 2005 p.2). The Hot Spot Analysis in ArcGIS 9 identifies spatial clusters of statistically significant high or low attribute values. This tool defines clusters of census blocks that have more than expected crime incidents. These clusters are hot spots. The Hot Spot Analysis tool also defines spatial clusters of lower than expected crime incidents. These clusters reveal crime cold spots and may provide clue about policy or environmental factors that discourage crime (Scott and Warmerdam 2005).

This research will employ similar (spatial statistics and hot spot analysis) tools, in ArcGIS 9.1 as described above, to conduct Hot Spot Analysis. However, in contrast to above narratives, this approach will be applying neighborhood area theory techniques. Neighborhood theories seek to describe incidences of disorder at higher scale than place or street theories. It compares and contrasts level of disorder at square block, communities, or census tracts (Eck et al. 2005). This research aptly adopted neighborhood strategy since it is concerned with "what areas have more violence and what areas have less." The available school violence data is at the level of administrative

boundary referred to here as school district. Neighborhoods and neighborhood clusters with high crime and disorder levels are linked to underlying social conditions (Eck, Chainey, Cameron, Leitner, and Wilson 2005). “The appropriate units of analysis are quite varied and can include square blocks, communities, and census tracts, to name a few. Two-dimensional shapes such as ellipses, rectangles, and other polygons are used on maps to represent crime phenomena at this level” (Eck et al. 2005 p17).

In her dissertation, Esther Lily Jones (2002) examined the association between school size, poverty level, ethnicity, gender, grade level and district demographics and school violence in Texas public schools. This study found a strong relationship between school violence and economically disadvantaged students. The dissertation also demonstrated statistical significant differences in incidents of “school violence” activity by “ethnicity,” “gender,” “grade level,” and “district size.” She concluded with a suggestion for school violence prevention programs, recommendations to the districts and for further study (Jones 2002). While this research will seek to repeat the statistical search for associations as well as make recommendations as noted above, it will approach the problem differently. In contrast to Jones (2002), this research will use larger samples, linear and multiple regressions as considered necessary.

CHAPTER IV

RESEARCH DESIGN AND METHODOLOGY

Data Sources

The school violence data were obtained by Texas Education Agency (TEA) from 1,041 school districts and charter schools in the State of Texas under Chapter 37 / Safe School Division (<http://www.tea.state.tx.us/safe/>). The Texas Education Agency collects Public Education Information Management System (PEIMS) 425 records data from all school districts relating to disciplinary actions as required by Chapter 37 of the Texas Education Code and Federal law. These data cover school violence, disciplinary actions taken, socio-economic status, ethnicity, gender, grade level, and demographics of the district where violence incidence occurred in Texas schools. The study area is the 1,041 independent school districts served by twenty geographic regional “Educational Service Centers” (ESC) in the state of Texas. The school districts polygon, Independent School District (ISD) boundary layers, and school violence data were obtained from TEA website and from Public Education Information Management System (PEIMS) records (<http://deleon.tea.state.tx.us/SDL/SDLdownload.asp>, and <http://www.tea.state.tx.us/safe/>).

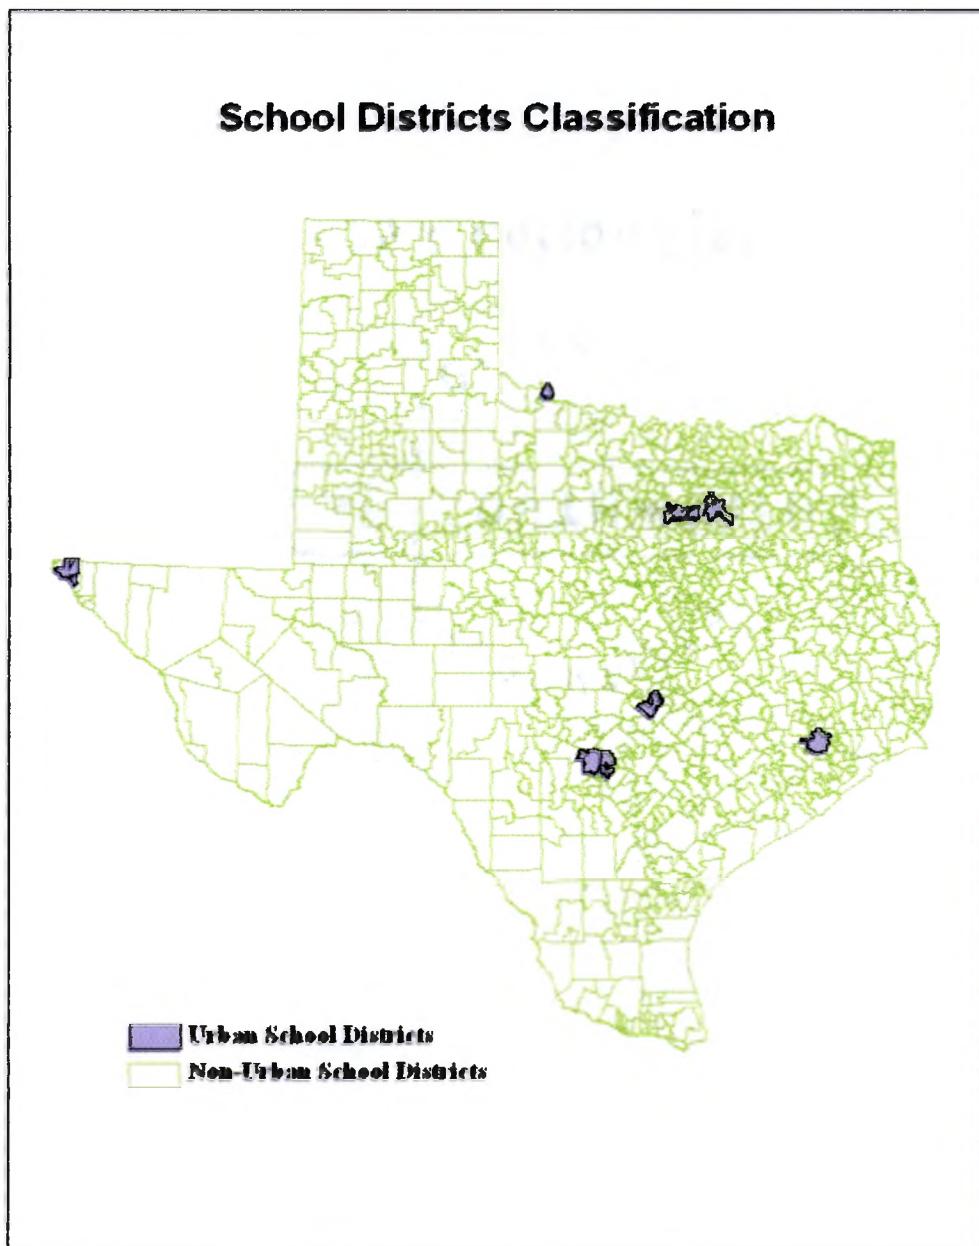

Other data collected from TEA include a list of school district’s classification into urban, suburban and rural districts but suburban and rural will be referred to as “non-urban” in this study. Texas education agency classifies school districts based on their

enrollments. An examination of this classification shows that as of April 22, 2004, only ten school districts have a classification of “major urban districts”, while all other school districts in Texas are either major suburban or rural. Table 1 below shows urban school districts and the percentage of their ethnic make up. Figure 2 below illustrates the districts and their locations in Texas map. The ten urban school districts are Houston, Dallas, Fort Worth, Austin, Northside, El Paso, Arlington, San Antonio, North East and Ysleta independent school districts in order of their enrollments size.

Table 1: Urban School Districts Enrollment 6th-12th grade (2003).

| <i>Urban Districts</i> | <i>Enrolment</i> | <i>BLACK</i> | <i>HISPAN</i> | <i>WHITE</i> | <i>Other</i> |
|-------------------------------|-------------------------|---------------------|----------------------|---------------------|---------------------|
| <i>6th-12th</i> | | | | | |
| HOUSTON ISD | 91394 | 32.10% | 53.37% | 11.14% | 3.39% |
| DALLAS ISD | 74780 | 36.96% | 53.80% | 7.70% | 1.54% |
| FORT WORTH ISD | 38109 | 30.59% | 46.71% | 20.59% | 2.12% |
| AUSTIN ISD | 37280 | 14.71% | 46.92% | 35.69% | 2.68% |
| NORTHSIDE ISD | 35418 | 7.38% | 54.84% | 35.20% | 2.59% |
| EL PASO ISD | 31955 | 4.38% | 78.16% | 15.88% | 1.58% |
| ARLINGTON ISD | 30732 | 22.67% | 23.41% | 46.69% | 7.23% |

| NORTH EAST ISD | 28816 | 9.31% | 38.83% | 48.91% | 2.95% |
| YSLETA ISD | 24205 | 2.48% | 88.04% | 8.50% | 0.98% |

Figure 2. School Districts Classification.

The school violence data collected were not quite ready for the analysis intended; hence some data transformations were necessary. The PEIMS records covering grades 6 through 12 were downloaded, converted to Microsoft Excel files and saved in .dbf file format to be read by GIS software. The boundary and the school layers have different

projections making it difficult to overlay them. They needed to be projected to bring both to identical projections and overlaid. The district boundary and the schools' point layers were therefore transformed by defining their projections to Texas Centric/Lambert Conformal and added to ArcMap. The school district and school violence tables were then joined using as a key, the PEIMS number. After the join, a summary of the table of the new layer was done using "District field," the index field. The research interest is the school district violence, so the result of the join was exported and saved as Districtsch_violence. In this form, spatial operation can be performed to answer the research questions stated above.

Spatial Design

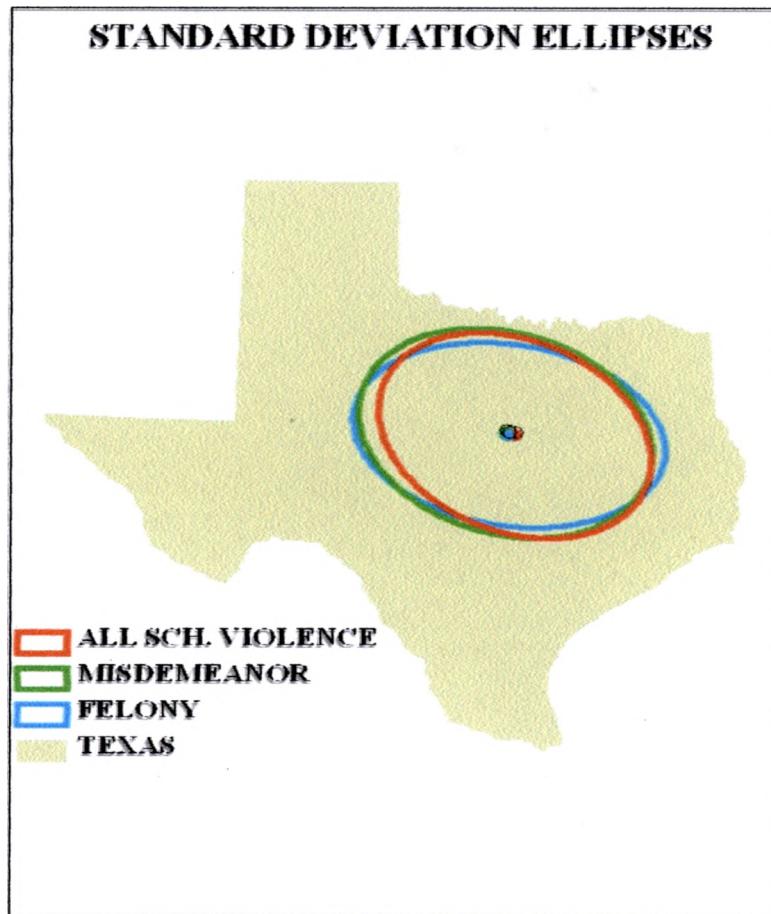

Spatial analysis was used to answer the questions and display "where" in Texas are violence hotspots school districts. This analysis uses hotspot analysis to identify hotspot school districts and to check for existence of clusters, if any. Two types of hotspot studies were conducted using two distinct techniques. One was conducted on the overall violence and used to locate clusters and hotspots of violence across the state of Texas. The second looks at each district and compares felony and misdemeanor to overall incidents in that district. By calculating the percentage of felony or misdemeanor, the rate of either violence was compared. It was easy to identify which districts have the highest rate of felony or misdemeanor. This helps to spot districts with potential danger of higher school violence.

Hot Spot Analysis: Hot spot has been defined as "an area that has a greater than average number of criminal disorder events, or an area where people have a higher than average risk of victimization" (Eck 2005 p. 2). "The Hotspot Analysis tool in ArcGIS 9.1

identifies spatial clusters of statistically significant high or low attribute values" (Scott and Warmerdam 2005 p.5).

Preliminary investigations were conducted to analyze patterns of school violence using spatial statistics function in Arc toolbox. The three tests were, a test for dispersion or standard deviational ellipse, Getis-Ord Gi* statistic, and a test for clustering or spatial auto correlation. The purpose of these tests is to inquire whether there is evidence of clustering prior to delving into hotspot analysis. If there is no indication of presence of clusters, hot spot analysis may be considered unnecessary and other alternative techniques will be used for the investigation. These tests are regarded as necessary preliminary tests prior to hot spot analysis (U.S. Department of Justice 2005). The test for dispersion is used to measure whether distribution from mean center is more toward one direction than another direction. This is done using standard deviation ellipse technique. The mean center was calculated followed by standard (deviation) distance in the x and y directions of each mean center.

Figure 3. Test for Dispersion (Standard Deviation Ellipses).

These two values provide the axes of an ellipse encompassing the distribution of school violence features. The ellipse is called standard deviational ellipse. The size and shape enables the determination of the degree of dispersion while its orientation indicates the trend. Ellipses were computed for school violence, misdemeanor and felony. Figure 3 is standard deviation ellipses for the three school violence categories. The differences in sizes and alignments of these ellipses explain the differences in dispersion and alignment of the violence categories. The ellipse in red represents all school violence category and

has the least area or dispersion. Misdemeanor and felony ellipses are relatively wider and hence more dispersed. The northwest and southeast orientation suggest the directional trend of school violence. With the degree of dispersion and orientation established, a test for clustering or Getis-Ord Gi* statistic was embarked upon as detailed below.

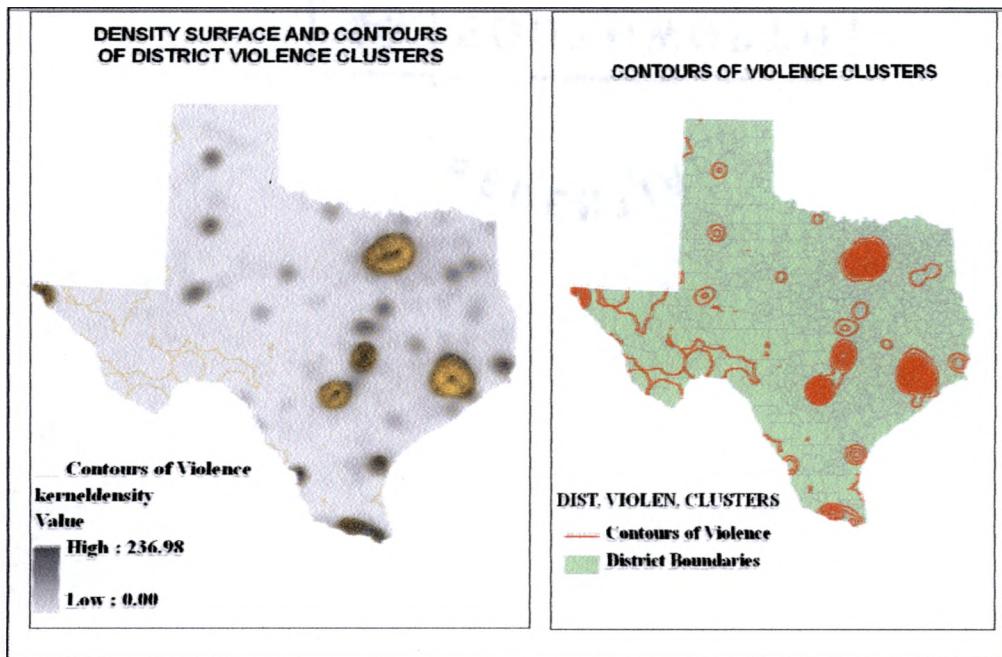

Cluster mapping, employing Spatial Statistics' Hot Spot Analysis: Getis-Ord Gi* statistic function, was then conducted. Getis-Ord Gi* (Spatial Statistics) locates spatial clusters of high or low attribute values that are statistically significant. G-statistic indicates if a given area has clusters of high or low values. It does not calculate high and low simultaneously. A high G- statistic indicates that values higher than the mean for the study area is found together, while a low G-statistic demonstrates a lower than the average for the area is seen together. This statistic resulted in high G-statistic ranging from 1.87 to 16.68 and lows of 0.001 to -0.325. These high G's suggest presence of clusters of school violence, while the low Gs indicate absence of clusters. This continuing affirmation of potential presence of clusters necessitated the third (spatial auto correlation) and final exploration prior to hot spot analysis.

Spatial Autocorrelation: Moran's I (Spatial Statistics) uses feature locations, attribute values, or both to measure similarity of those features. It determines whether there is a random, clustered, or dispersed pattern based on Moran's Index. The index value ranges from +1 and -1. A positive value designates clustering while negative values stand for dispersion. Z score is also calculated to measure statistical significance of the resulting Moran's Index. Spatial autocorrelation measures whether the distributions of phenomena are related; that is positive spatial autocorrelation (Chainey 2005). The spatial autocorrelation result shows Moran's Index of + 0.05 and also returned a Z-score

of 27.6 standard deviations. This positive Moran's Index signifies that there is 99.95% certainty that clusters of school violence is present in Texas school districts. The high Z-score confirms the statistical significance of that presence of clusters.

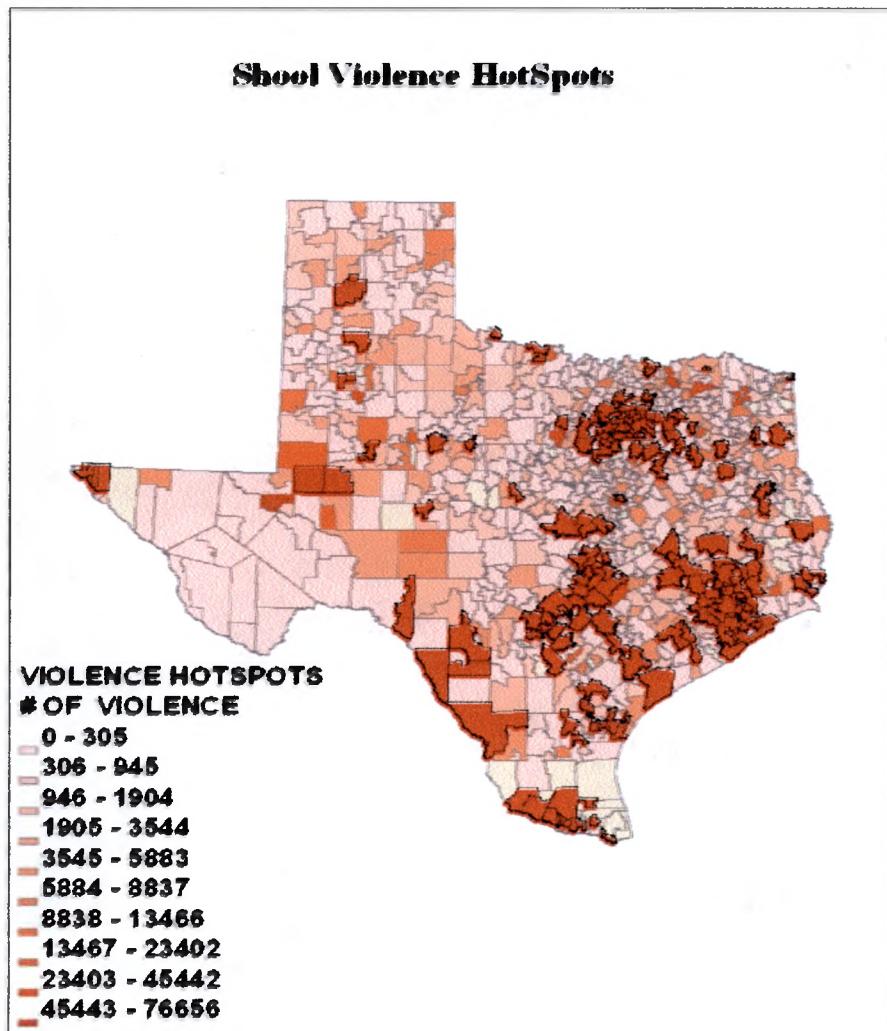

A density surface is then fitted, depicting the density or intensity of school violence across the state of Texas using Kernel Density technique. The boundary of this surface is defined by the geographical extension of school violence since there is no extrapolation save for the minimum and maximum latitude and longitude of school districts limits see Figure 4. Kernel Density computes a magnitude per unit area from polygon features and utilizes a kernel function to fit a smooth surface across the area (Silverman 1986).

Figure 4. Kernel Density & Contours of Violence Clusters (Enhancing Visualization of Hotspots).

To improve the visualization of hot spot analysis above, a contour map was created. Contours create feature class of isolines, or contours, representing constant cell values in the input class as shown in red in Figure 4 on the right side above. The outer bounds of these isolines tend to extend beyond actual map boundaries since it follows density surface and is set to a constant spacing of 10 meters. Clipping the layers based on the Texas State boundary solved this problem.

Figure 5. Hotspot Map: Texas Public School Districts.

In Figure 5, as the color get darker, districts with more counts of violence are highlighted. Districts with the most reported violence range from 45,443 - 76,656 total incidents.

The issue of determining “what district(s) has the highest felony violations,” involves the application of definition query. The felony field was queried to select all the districts that have their record higher than the mean of all the districts. An inspection of

the attribute field shows the districts with highest rate of felony. Houston independent school district reported the highest incidences of felony at one thousand seven hundred and nine.

The question of “what district(s) has the highest misdemeanor violations,” also needs the application of definition queries. The misdemeanor field was queried to select all the districts that have their record higher than the mean of all the districts. An inspection of the attribute field shows the districts with highest rate of misdemeanor. Houston independent school district reported the highest misdemeanor incidences of seventy six thousand, six hundred fifty six.

The average incidence of school violence is obtained from the SchViolen field. In the attribute table, a statistical function was invoked while the field alone was highlighted. This yielded the sum, standard deviation and the mean of collective violence (Misdemeanor and Felony combined). The mean or average incidence for the state was 1467.

Questions #5, #6, and #7, were answered using choropleth-mapping tools in Arcview. Choropleth maps show the comparative density of a phenomenon across an area by assigning different shade or graduated colors ranging from light to dark.

There are four options for classification as long as the scheme chosen, minimizes inner class variance while maximizing the between class variance (Chainey and Dando 2005). Felony clusters were therefore, located by symbolizing the district violence layer based on felony and schviol fields. The method of classification used was natural breaks based on preliminary review of descriptive statistics. Natural breaks classification of aggregated

data, made it possible to isolated extreme outliers and exposed districts with high felony rate and districts with lowest rate. The resulting maps are labeled and compared with the TEA district classification, to determine which ones are urban and which ones are non-urban, see Table 2. The result of this comparison revealed the answers to “are there clusters of felony in urban school districts?” and “are there clusters of felony in non-urban school districts?” A map showing felony clusters was saved as “*FELONY HOT SPOT MAP: TEXAS PUBLIC SCHOOL DISTRICT*”, Figure 6 shows a five category classification map of felony hotspots.

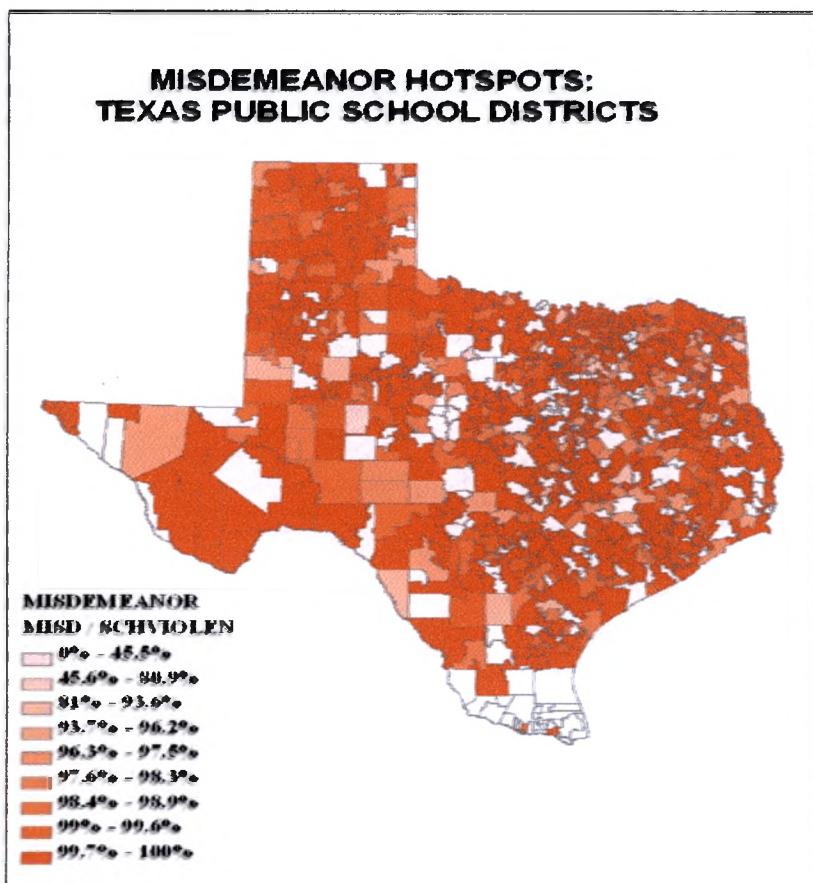

Figure 6. Felony Hotspots Map: Texas Public School District.

Misdemeanor clusters were located by symbolizing the district violence layer based on misdemeanor and school violence fields. The method of classification used was

also natural breaks as detailed above. This result answered the questions “are there clusters of misdemeanor in urban school districts?” as well as “are there clusters of misdemeanor in non-urban school districts?” This map was also saved as “*MISD. HOT SPOT MAP: TEXAS PUBLIC SCHOOL DISTRICT*”, Figure 7 shows the ten category classification map.

Figure 7. Misdemeanor Hotspots Map: Texas Public School District.

Statistical Design

Non-spatial statistical analysis was conducted on computer using “Statistical Package for the Social Science for Windows (SPSS 14)” simple linear regression. If X_1 is used to represent ethnicity variable, X_2 for gender, X_3 for grade level and then Y for school violence (dependent variable), linear regression model attempts to explain this relationship with a straight-line fit to the data. Regression analysis uses an equation to describe the nature of the relationship between independent and dependent variables. It also yields variance measures to assess the accuracy of regression equation (Kachigan 1991). The ethnicity variable measures the percentage of non-white students in a school district. Other variables include gender that measures the percentage of male students and grade level measuring the percentage of middle school students (grades 6th to 8th). The dependent variable (schviolen), is the ratio of the total number of school violence reported by each district to the total of that school district’s student enrolment in 6th to 12th grade. It is expected that this regression result will yield positive relationship between all the independent variables and the dependent variable. Table 3 is the summary of variables, how the variables would be measured and what is measured. It also shows the expected relationship resulting from the measurements. The positive signs in the expected relationship column illustrate the expectation that all independent variables will be positively related to the dependent variable (school district violence).

Table 3: Regression Variables and Measurements.

| TYPE OF VARIABLE | VARIABLES | MEASUREMENTS | EXPECT. RELATION-SHIP |
|------------------------------|----------------------------------------------------|---------------------------------------------------------------------------------------------------------------|------------------------------|
| Dependent Variable | SCHVIOLEN <i>(School Violence)</i> | # of School Violence in a School District School District Student Enrolment in 6th - 12th | |
| Independent Variables | Ethnicity <i>(Racial Make-up)</i> | District's Non-white student Enrolment Total Student Enrolment (6th - 12th) for the district | + |
| | Gender <i>(Gender Ratio)</i> | District's Male students Total Student Enrolment (6th - 12th) for the district | + |
| | Grade Level <i>(Grade level make up)</i> | District's 6th - 8th Total Student Enrolment (6th - 12th) for the district | + |

Regression analyses were conducted to determine if there was a relationship between the overall district violence (the criterion variable) and gender, or ethnicity, or grade level, or all independent variables. These null hypotheses to be tested with statistical analysis are:

- (1) There is no relationship between ethnicity and school violence.
- (2). There is no relationship between genders and school violence.
- (3). There is no relationship between grade-level and school violence.

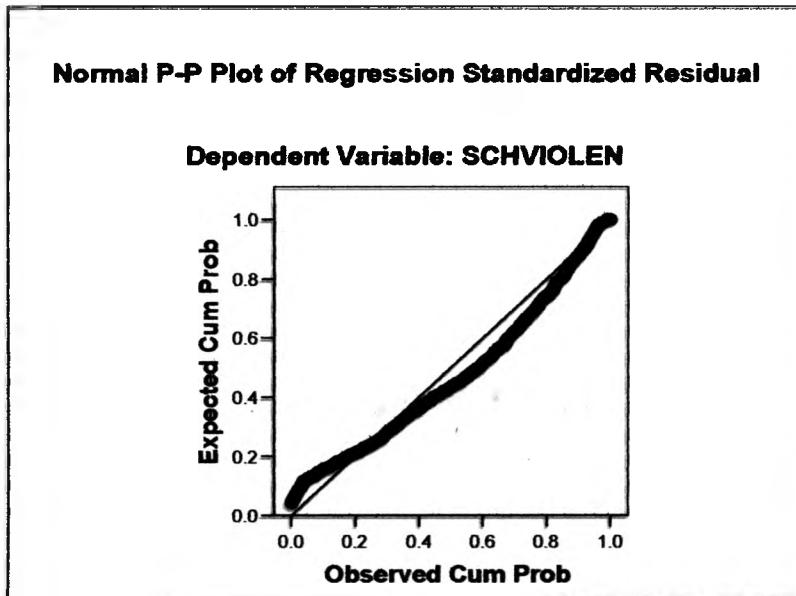

Model 1 tested for a relationship between school violence and ethnicity and the model equation is “**DistSchviol = a + b(Ethnicity) + e.**” Model 2 looked for a relationship between gender and school violence with a model equation of “**DistSchviol**

$= a + b(\text{Gender}) + e.$ " The third model checked for the potential relationship between grade level and the school violence using the following equation: "**DistSchviol = a + b(Grade Level) + e.**" The validity of the above analysis was checked with general linear regression model involving all independent variables and the dependent variable as model 4. The model equation is as follows,

$$\text{"DistSchviol} = a + b_1(\text{ethnicity}) + b_2(\text{gender}) + b_3(\text{grade level}) + e."$$

Coefficients (b_1 , b_2 , and b_3) indicate by how much district violence increases as one variable increases by one, while holding the other two variables constant.

Table 4 is a normal plot of standardized residual that compares the expected cumulative probability with observed cumulative probability and attempts to fit a linear curve. Variables are rarely perfectly related, there could be an error introduced when linear regression equation attempts to describe an imperfect relationship. The Std. Error of the Estimate provides an overall accuracy of how discrepant the test scores are from the predicted regression line. This means that the actual scores could vary by "e" points above and below the predicted value.

Table 4: Normal P-P Plot of Standardized Residual.

The correlation coefficient R (the square root of R-square) derived, expresses the degree to which the predictors (Gender, Ethnicity, and Grade level variables) are related to the dependent (DistSchviol) variable. R assumes values between 0 and 1. The direction of the relationship between variables is determined by the “plus or minus” signs of the regression or B coefficients. If B coefficient is positive, the relationship of this variable with the dependent variable is positive. If B coefficient is equal to 0, there is no relationship between the variables.

CHAPTER V

RESULTS AND ANALYSIS

Analysis

This analysis was conducted using basic descriptive statistics, general linear model regression to measure the relationship between the independent variables, gender (male and female), ethnicity (Black, Hispanic, White, Other), and grade-level (6th, 7th, 8th, 9th, 10th, 11th, and 12th), and the dependent variable, school district violence (Felony and Misdemeanor). The goal is to describe the relationship between the predictors such as gender, ethnicity, and grade level and the dependent variable, school district violence (the criterion variable) using general linear regression model. The relationship between the dependent variable ‘school violence’ and the predicting variables ethnicity, gender, grade level was examined. The null hypotheses addressed with statistical analysis were as stated under statistical design section.

Results of Statistical Analysis

A review of regression output illustrates an interesting relationship between the predictor variables and the dependent variable (school violence). The school violence and ethnicity regression equation is **DistSchviol = 0.284 + 0.513(ethnicity) + 0.4600**. This is to say that if the percentage of non-white goes up, district school violence will increase by 0.513, when other predictors are constant. Since ethnicity is the ratio of non-white student enrolment in a district, it could be inferred that as the percentage of white

enrolment increases, school district violence decreases. The confidence level interval for this analysis is 95%; this means that this study is predicting significance at 0.05 but the resulting (observed) significance is 0.00, meaning that the relationship between ethnicity and school violence is statistically significant. Table 5 is an output of regression analysis referred to as model summary. Model Summary table displays the correlation coefficient R. The R Square, or coefficient of determination, is a measure of "goodness of fit" and it suggests that 8.1% of the behavior of school violence is accounted for by this model.

Table 5: (Model 1) Summary of Regression.

| Model | R | R Square | Adjusted R Square | Std. Error of the Estimate |
|-------|-------------------|----------|-------------------|----------------------------|
| 1 | .285 ^a | .081 | .081 | .4600081 |

a. Predictors: (Constant), Ethnicity
b. Dependent Variable: SCHVIOLEN

In model 2, the school violence and gender regression has an equation:

DistSchviol = 0.292 + 0.360(gender) + 0.47989. Just as described above, when gender changes by one, school violence increases by 0.360. Gender stands for the proportion of a district's student enrolment in 6th through 12th that are male; therefore an increase in male enrolment is related to an increase in that district's school violence. In other words, male students are more likely to be assigned to disciplinary alternative education or commit violence offense than their female counterpart. As a district's student population increases, the difference between male enrolment and female enrolment decreases,

resulting in a narrowing gap between male and female committing school violence. This may be a reason for the gender model to return a significance level of 0.403. This number is more than the expected margin of error and hence renders this model statistically insignificant. Table 6 shows the R-squared of 0.00 which suggests a weak relationship between gender and school violence.

Table 6: (Model 2) Summary of Regression.

| Mod | R | R Square | Adjusted R | Std. Error of the Estimate |
|-----|------------------|----------|------------|----------------------------|
| 1 | .02 ^a | .00 | .00 | .47979 |

a. Predictors: (Constant),
b. Dependent Variable:

Grade level has a negative relationship with school violence as demonstrated by the regression equation: **DistSchviol = 0.697 - 0.471(grade level) + 0.4765**. If grade level changes by one, school violence changes by -0.471. Grade level is the proportion of students enrolled in 6th through 8th grade compared to the total enrolment in 6th to 12th grade. As the middle school enrolment increases, school violence decreases. Looking at the data, this may be supported since high school has higher proportion of school violence. At 0.05 significance and with model 3 returning 0.00 significance, the finding is statistically significant. Table 7 is the model summary table displaying the correlation coefficient R. The R Square or coefficient of determination is a measure of "goodness of

fit" and it suggests that 13% of the behavior of school violence is accounted for by this model.

Table 7: (Model 3) Summary of Regression.

| Mode | R | R Square | Adjusted R2 | Std. Error the Estimate |
|------|-------------------|----------|-------------|-------------------------|
| 1 | .119 ^a | .014 | .013 | .476537 |

a. Predictors: (Constant),
b. Dependent Variable:

Model 4 summarizes the overall relationships in a single equation, enabling the comparison of all variables using adjusted R Square. The Adjusted R Square is the adjustment of the samples for degrees of freedom lost in the estimation of the regression. Variables are rarely perfectly correlated, since an error could be introduced as linear regression equation attempts to describe an imperfect relationship. The Std. Error of the Estimate provides an overall accuracy of how discrepant the test scores are from the predicted regression line.

Table 8: (Model 4) Summary of Regression.

| Model Summary^b | | | | |
|----------------------------------|-------------------|----------|-------------------|-------------------------|
| Mode | R | R Square | Adjusted R Square | Std. Error the Estimate |
| 1 | .307 ^a | .094 | .091 | .457316 |

a. Predictors: (Constant), GradLevel, Ethnicity, Gender
b. Dependent Variable:

Table 8 shows Std. Error of the Estimate (e) 0.4573. This means that the actual scores in model 4 could vary by 0.4573 "points" above and below the predicted value. The ANOVA (Table 9) presents a test of significance for the overall regression model. Given a significance level of .05 and comparing the model Sig. of 0.000 suggests that the estimated model is relevant and is statistically significant.

Table 9: ANOVA (b).

| ANOVA ^b | | | | | |
|--------------------|----------------|------|-------------|--------|-------------------|
| Model | Sum of Squares | df | Mean Square | F | Sig. |
| 1 Regression | 21.751 | 3 | 7.250 | 34.667 | .000 ^a |
| Residual | 209.766 | 1003 | .209 | | |
| Total | 231.517 | 1006 | | | |

a. Predictors: (Constant), GradLevel, Ethnicity, Gender
b. Dependent Variable: SCHVIOLEN

The Coefficients (Table 10) provides the actual numbers needed to test the equation describing the model. When several independent variables are involved, Beta value is used to rank those variables. Standardized coefficients bring all predictors to a common unit (z-scores) so comparison could be made.

Table 10: Coefficients (a).

| Model | Unstandardized Coefficients | | Beta | t | Sig. |
|--------------|-----------------------------|------------|-------|--------|------|
| | B | Std. Error | | | |
| 1 (Constant) | .281 | .226 | | 1.244 | .214 |
| Ethnicity | .507 | .054 | .282 | 9.376 | .000 |
| Gender | .386 | .411 | .028 | .939 | .348 |
| GradLevel | -.419 | .119 | -.106 | -3.523 | .000 |

a. Dependent Variable: SCHVIOLEN

The higher the magnitude of the Beta value, the more influence the variable has on the overall model. Gender with a Beta value of 0.411 has the most influence in this model in predicting school violence. Grade Level has a beta of 0.119 and hence less influence than Gender. Ethnicity has the least influence, with a beta of 0.054, of all predictors considered in predicting school violence. The whole regression model equation could therefore be written as:

"DistSchviol = 0.281 + 0.507(ethnicity) + 0.386(gender) - 0.419(grade level), the Std. Error of the Estimate is **0.4573167**. The negative value of grade level coefficient signifies its inverse relationship with school violence. Other variables have positive relationships.

Table 11 summarizes the above discussion.

Table 11: Regression Results.

| REGRESSION MODEL | ADJUSTED R2 | ETHNICITY | | GENDER | | GRADE LEVEL | |
|-------------------------|--------------------|------------------|-------------|----------------|-------------|--------------------|-------------|
| | | b value | Sig. | b value | Sig. | b value | Sig. |
| MODEL 1 | 0.081 | 0.513 | 0.000 | | | | |
| MODEL 2 | 0.000 | | | 0.360 | 0.403 | | |
| MODEL 3 | 0.013 | | | | | 0.471 | 0.000 |
| MODEL 4 | 0.091 | 0.507 | 0.000 | 0.386 | 0.348 | -0.419 | 0.000 |

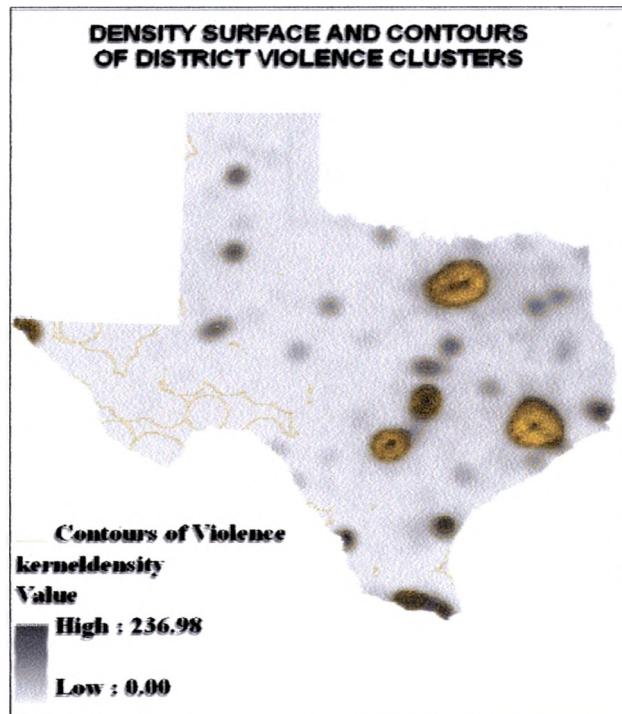

The null hypotheses, "There is no relationship between ethnicity and school violence," "There is no relationship between grade-level and school violence," were both rejected. The null hypothesis, "There is no relationship between genders and school violence," is not rejected due to high level of significance in both individual model and

the combined model, 0.403 and 0.348 respectively; for further review of regression outputs, see appendix A.

Result of Spatial Analysis

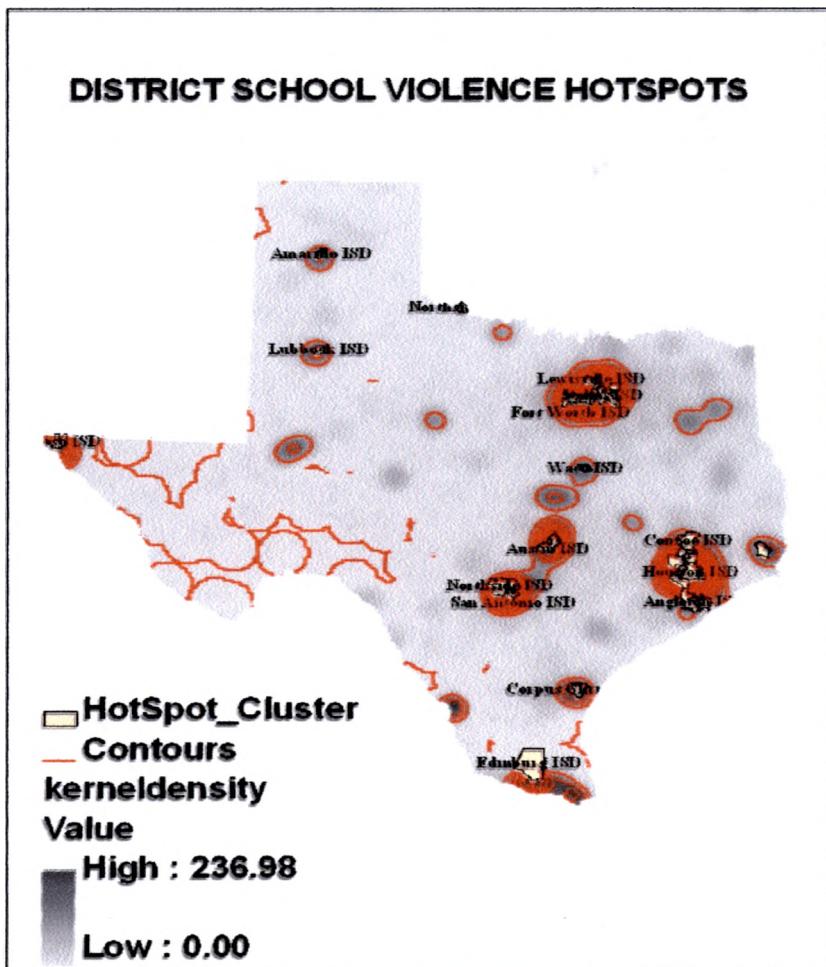

All preliminary tests suggested the presence of cluster that was confirmed by violence density surface. The first spatial question was to find where school violence Hotspots exists. School violence hotspots are defined as districts that have greater than average number of school violence incidence, or districts where students have a higher than average risk of being referred to disciplinary alternative educational program (DAEP). Figure 8 is the violence density surface and contours of violence clusters. The area with higher standard deviation depict district with violence clusters in dark patches while those with light gray indicate that there may be absence of clusters.

Figure 8. Violence Density Surface & Contours of Violence Clusters.

There were one hundred and ninety two school districts reporting more than the average school violence for Texas public school districts. The average is one thousand four hundred sixty-seven incidents reported across the state of Texas. Figure 9 shows the clusters. A few of the largest clusters have been labeled for clarity. There are twenty-eight school districts reporting highest incidence (over ten thousand incidents) of violence. They range from 10,180 reported by Edinburg-Consolidated ISD to 76,656 reported by Houston independent school district. Most of these districts are suburban school districts as shown by ten districts listed here ranking from highest to the lowest as follows: Houston, Fort Worth, Northside, Aldine, Garland, Alief, Arlington, Dallas, Cypress-Fairbanks, and Austin school district. Out of the above ten school districts listed, Houston, Forth Worth, Dallas and Austin were urban school districts by definition, while six were suburban school districts. The five districts that reported the highest incidence of violence in Texas are Houston (76,656), Fort Worth (45,442), Northside (35,642), Aldine (32,205), and Garland (29,325). In the map of School District Violence Hotspots (Figure 9), the violence density is displayed by color intensity with light color representing less violence, and dark color indicating more violence. Contour lines are used to enhance the visualization of the hotspots delineated by surface density.

Figure 9. District School Violence Hotspots.

In all, one hundred ninety two clusters were identified across the state of Texas.

The School District Violence Hotspot map shown above shows the clusters made up thirty-one districts reporting ten thousand incidents or more. The largest of these clusters include Houston-ISD, Dallas-ISD, and San-Antonio-ISD area clusters all of which are shown below in Figures 10, 11 and 12 respectively.

Figure 10. Dallas ISD Area Hotspot Clusters.

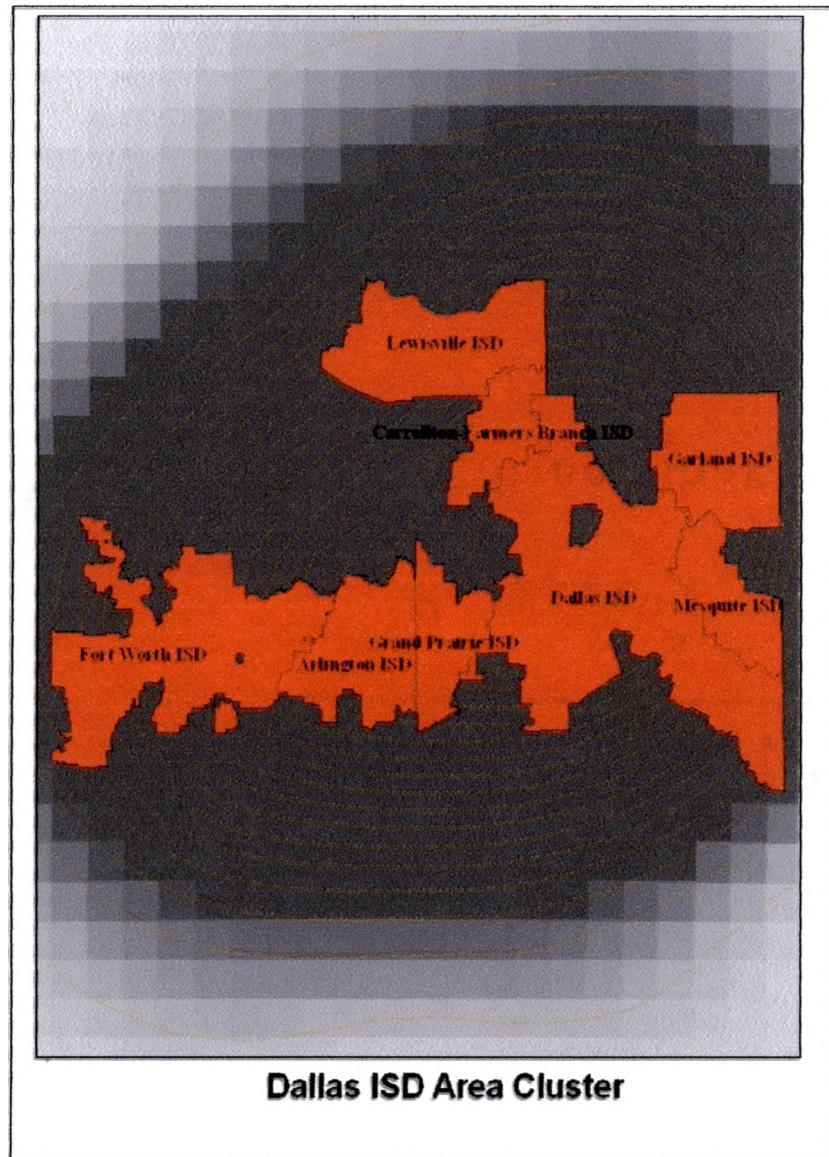

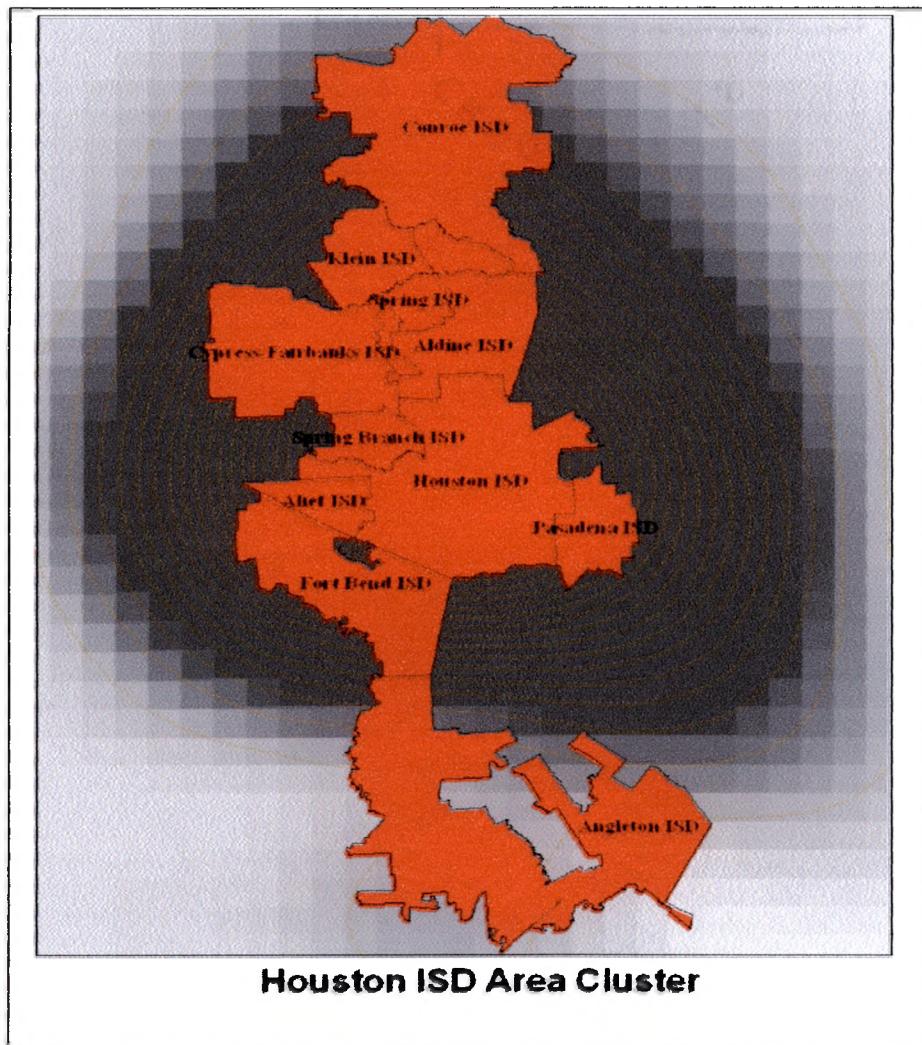

Figure 10 shows the largest cluster consisting of Lewisville, Carrollton-Farmers Branch, Garland, Mesquite, Dallas, Grand Prairie, Arlington, and Fort Worth school districts. This cluster has four of the top ten districts reporting most school violence. Dallas, Fort Worth, Arlington and Garland are all in the top ten. Figure 11 is the Houston

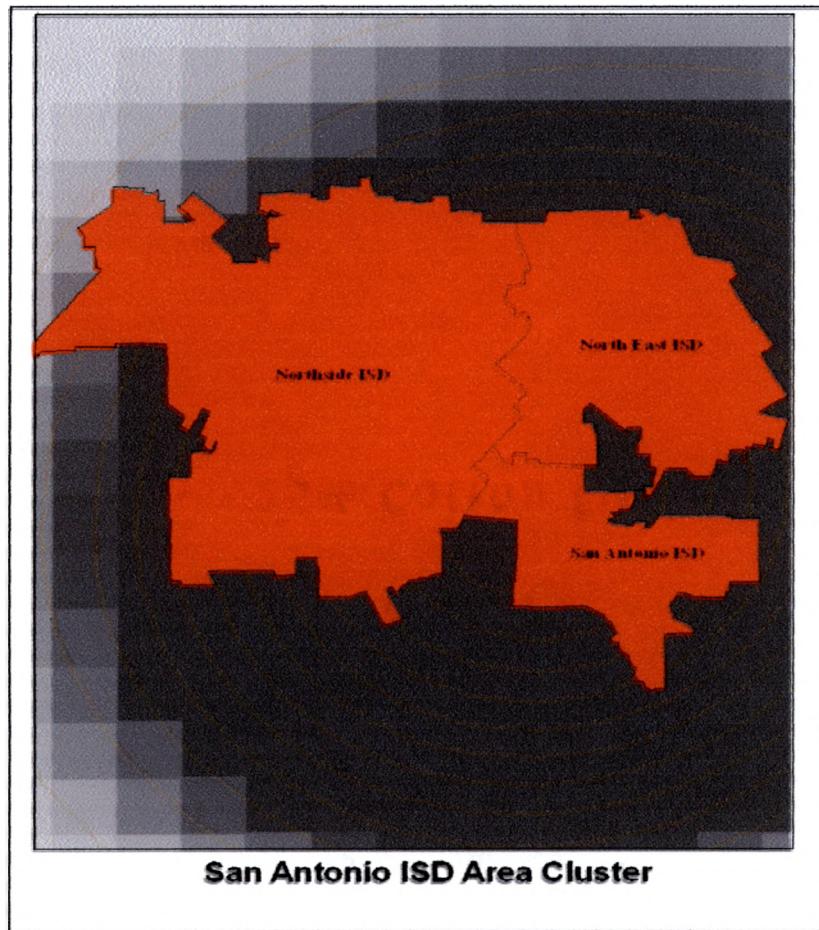

area clusters; it comprises many more districts than Dallas area cluster. Looking at these clusters, it is evident that each of these clusters consists of at least one urban school district and many suburban school districts around it.

Figure 11. Houston ISD Area Hotspot Clusters.

The San Antonio area cluster (Figure 12) is comprised of only three school districts that have large student population or enrollment namely, North Side ISD, Northeast ISD, and San Antonio ISD.

Figure 12. San Antonio ISD Area Hotspot Clusters.

The second question investigated with spatial analysis is to identify the district(s) that has the highest rate of felony. The rate was used to show what percentage of a school district's reported violence was felony and what was misdemeanor. Comparing these

rates across the state enables the determination of where felony could be a severe problem. A school superintendent may want to know whether his /her district has common disciplinary issue (misdemeanor) or serious violent cases (felony) in order to respond appropriately. The number of felony violations in the report range from as small as five to as many as one thousand seven hundred nine. This study found that there were one hundred thirty eight school districts that reported incidences above the mean. By definition, all those districts are hotspots although felony mean is only twenty-one incidences. Figure 13 is a felony map showing highest felony rate districts, a few of which were labeled, while Figure 14 is a choropleth gray scale map. This gray scale map shows choropleth map of felony hotspots using color hue; the light shades indicate little or no hotspots, while the darker shades illustrate hotspots.

Numerically, large urban school districts tend to have more reported incidences of felony, but this research examined what could be a potential problem to a district. Understanding what proportion of violence is felony and what percentage is misdemeanor, enhances a district planner's ability to foresee danger and to plan for counter actions proactively. Felony rate map show clusters where no one would usually expect them, for instance Edgewood ISD, and Tahoka ISD. In Figure 13 twenty-four districts with highest rate of felony were labeled for clarity. Mart ISD has 59.46% and the highest rate of felony in the state, followed by Harper ISD with 54.55% and the third is East Bernard independent school district. All these are suburban or rural school districts. The only urban district that is a felony rate hotspot is El Paso with a 6.98% rate of felony. The map below suggests that, given the geographical distribution of the incidences in this

study, felony constitute larger proportion of the violence in non-urban school districts than in urban school districts.

Figure 13. Felony Rate Hotspots.

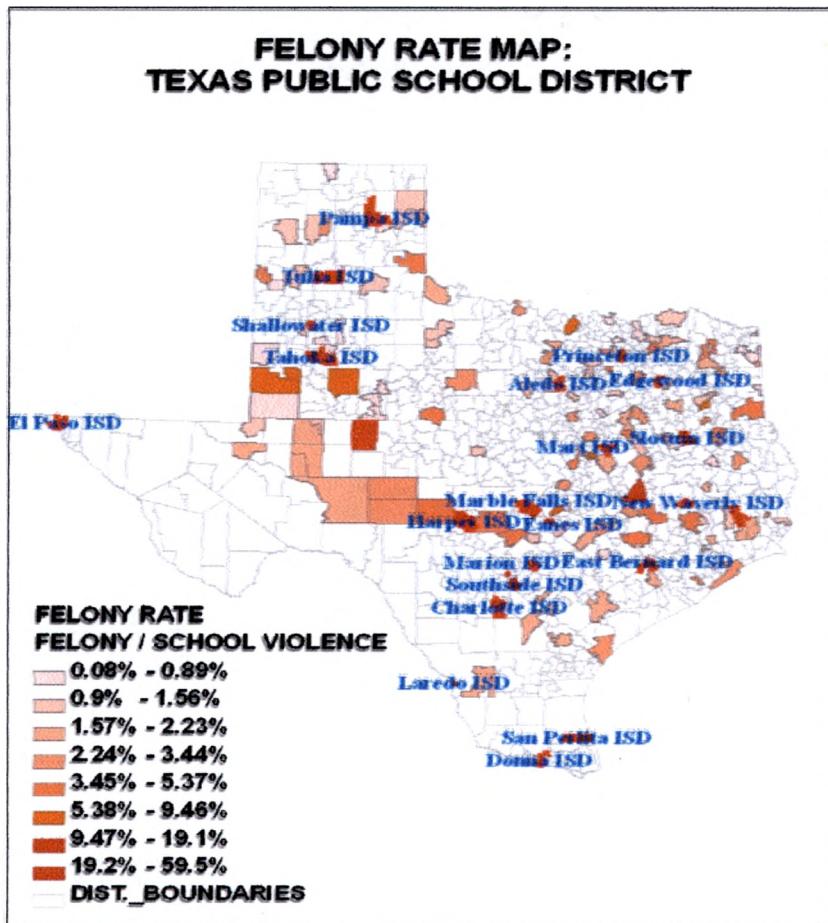

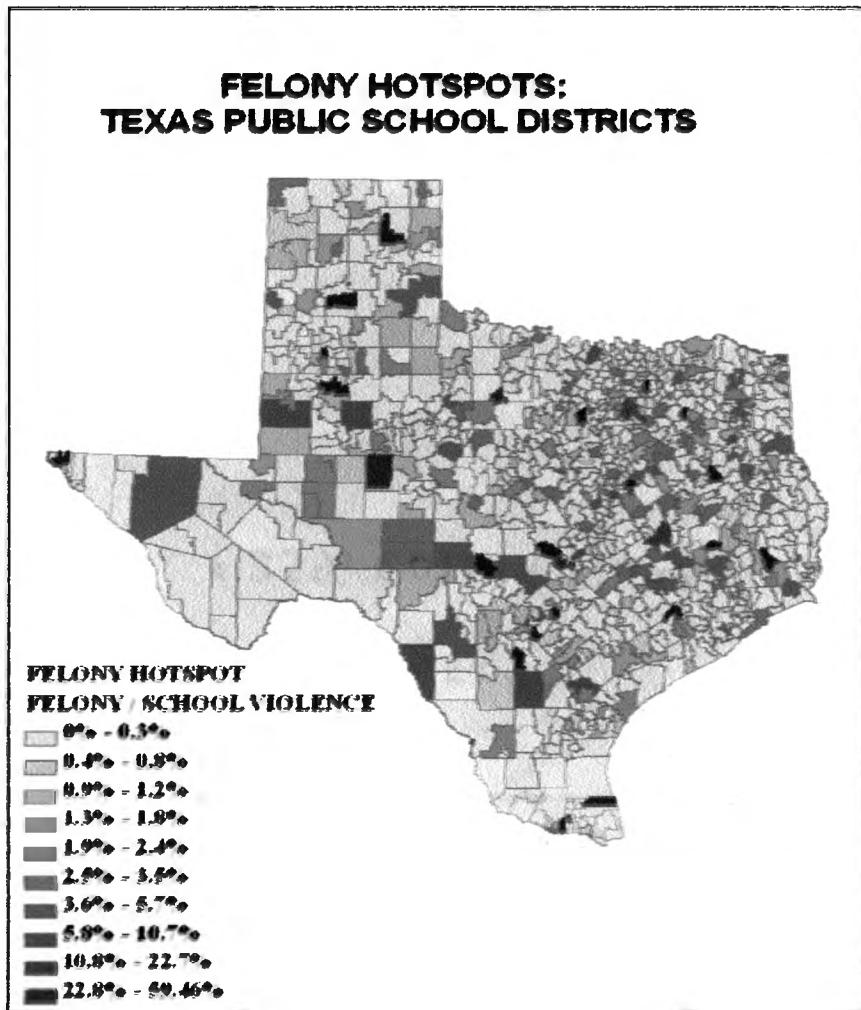

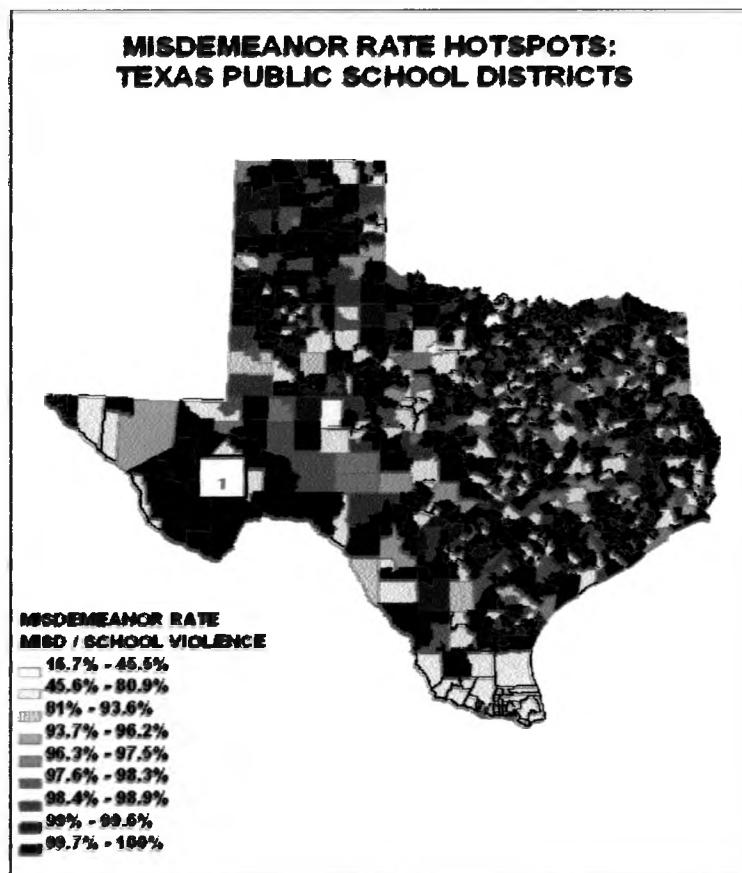

Figure 14. Choropleth Map of Felony Rate.

The third question investigated with spatial analysis is to identify the district(s) that has the highest rate of misdemeanor rate. This study also found that misdemeanor is ubiquitous in most school districts but constitutes the larger proportion of overall incidents in urban school districts. Misdemeanor incidence mirrored the distribution of overall violence. This is expected since misdemeanor made up most of the school violence in Texas. The result of misdemeanor rate tells an interesting story. Although

many districts are hotspots, some stand out vividly. There are over fifty school districts that reported one hundred percent misdemeanor among which are Pharr San Juan Alamo ISD, Richardson ISD, Birdville ISD, Ysleta ISD, United ISD, Uvalde Cons. ISD, Kingsville ISD, Rio Grande City ISD, Del-Valle ISD, and Georgetown ISD. These school districts reported no incidence of felony in 2003. In Figure 15, a choropleth map of misdemeanor rate Hotspots is displayed in gray scale; hues of gray demarcate the rate of violence. The most distinguishable cluster surround Ft Stockton ISD and is labeled number 1 on the map.

Figure 15. Misdemeanor Rate Hotspots Map.

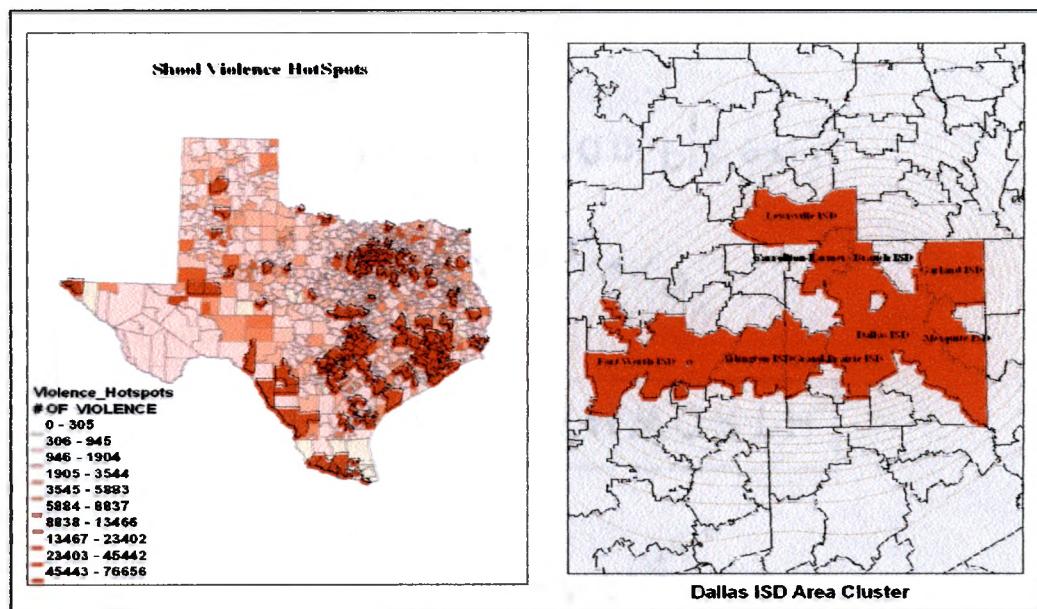

CHAPTER VI

CONCLUSIONS

The three major themes of this research are: 1). Are there spatial clusters or patterns of serious (felony) violence in suburban and rural school districts in Texas public school districts? 2). How do urban school districts compare to non-urban school districts in terms of the geographical distribution of school district violence? 3). What are the variables that have strong relationship with school violence in a school district? Why is all the focus on urban school districts when across the United States most of the fatal incidences of shooting have not been in central city school districts (Donohue, Schiraldi and Zeidenberg 2000)?

The first question investigated is whether there are spatial clusters or patterns of serious (felony) violence in suburban and rural school districts in Texas public school districts. An examination of the data revealed that felony is not usually a problem in Texas public school district since many districts reported little or no felony. On sub-problem 4, what types of school districts exhibit clusters of felony school violence, there are overwhelming evidence that felony represent higher proportion of all violence reported by non-urban school districts as presented earlier in Table 3. All felony rate hotspot districts are non-urban school districts with the exception of El Paso, which is classified as urban school district. This research, therefore, confirms that felony account for higher proportion of incidents of violence in non-urban districts.

Figure 16. School District Violence Hotspots & Dallas Area Cluster.

The second question analyzed was how urban school districts compare to non-urban school districts in terms of the geographical distribution of school district violence. Urban school districts reported numerous referrals to disciplinary alternative education program. However, districts in proximity of urban school districts tend to show large numbers of referral as demonstrated in the geographical distribution of overall school district violence displayed on Figure 16. On the left side of Figure 16 are the hotspots of school violence distribution, while displayed on the right is a detail of one of the hotspot clusters. The Dallas independent school district is an urban school district hotspot surrounded by numerous suburban school district hotspots. This hotspot districts cluster run from Fort Worth on the west to Mesquite and Garland ISD on the east. Out of these eight districts cluster, only Dallas and Fort Worth independent school districts are urban districts while the rest are suburban districts.

Table 12: School Violence Hotspot Clusters.

| Houston Area Hotspot Cluster | | <u>Non-Urban</u> | <u>Urban</u> |
|-------------------------------------|--|------------------|--------------|
| <u>School Districts</u> | | | |
| Conroe | | ✓ | |
| Klein | | ✓ | |
| Spring | | ✓ | |
| Cypress_Fairbanks | | ✓ | |
| Aldine | | ✓ | |
| Spring_Brandt | | ✓ | |
| Alief | | ✓ | |
| Houston | | | ✓ |
| Pasadena | | ✓ | |
| Fort Bend | | ✓ | |
| Angleton | | ✓ | |

The pattern is repeated across the state of Texas; as is also the case in the Houston area cluster (see Table 12). As of 2003, Houston area cluster consists of eleven hotspot districts but only Houston independent school district is an urban school district. Spatial distribution of violence clusters or patterns of overall school violence comprise both urban and non-urban school districts and not exclusive to urban districts, contrary to common believe.

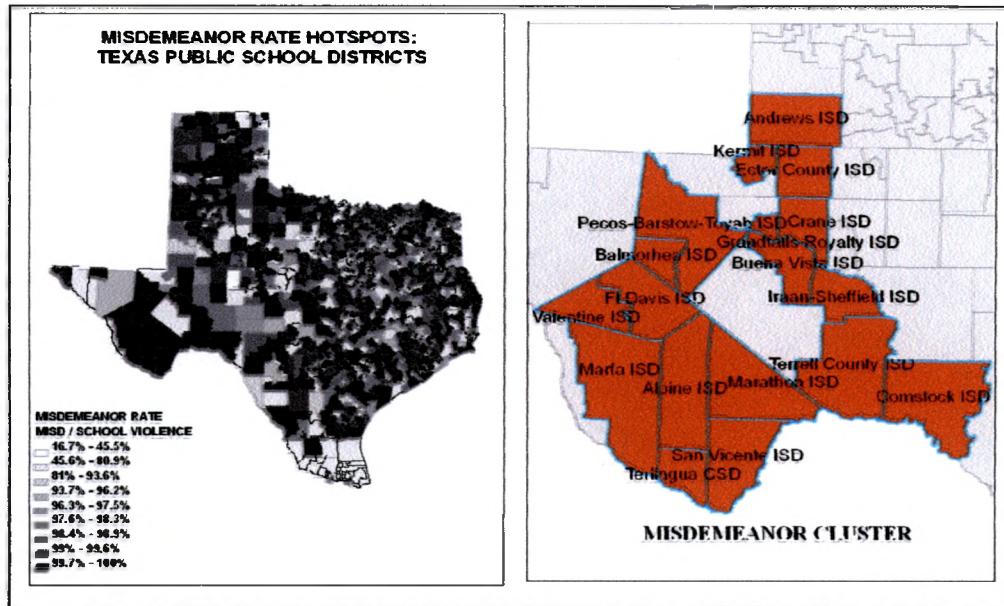

Table 13: District Violence Distributions & Classification.

A few districts and their classification including enrollment are shown above (see Table 13) in descending order of school district violence reported. Table 13 indicates that Houston and Fort Worth (urban districts) reported the highest number of incidences respectively; suburban districts reported the next five highest school violence. Dallas independent school district came in eighth of all reported violence. All these lead to the conclusion that school violence and juvenile delinquency are not exclusive to the inner city schools or urban school districts.

The investigation of sub-problem #5, what types of school districts exhibit clusters of misdemeanor school violence, is not conclusive whether urban or non-urban districts have higher proportion of misdemeanor or not. It is safe to say that the geographical distribution of misdemeanor supports its ubiquity in all districts regardless of classification. Choropleth map (Figure 17) indicates the presence of misdemeanor hotspots all over Texas with a number of clusters on the left, while the right is a detail of the largest of these clusters. This cluster is made up of the districts surrounding Fort Stockton (indicated in white at the middle). The cluster shown below comprises non-urban school districts. This cluster encompasses many more districts than those of combine school violence illustrated above (see Figure 7). It is therefore appropriate to conclude that the distribution of misdemeanor violations is even across the school districts in Texas. Unlike the distribution of overall violence (misdemeanor and felony included), which displayed clusters around urban school districts, misdemeanor clusters does not show distinguishable pattern.

Figure 17. Misdemeanor Rate Hotspots and Cluster Map.

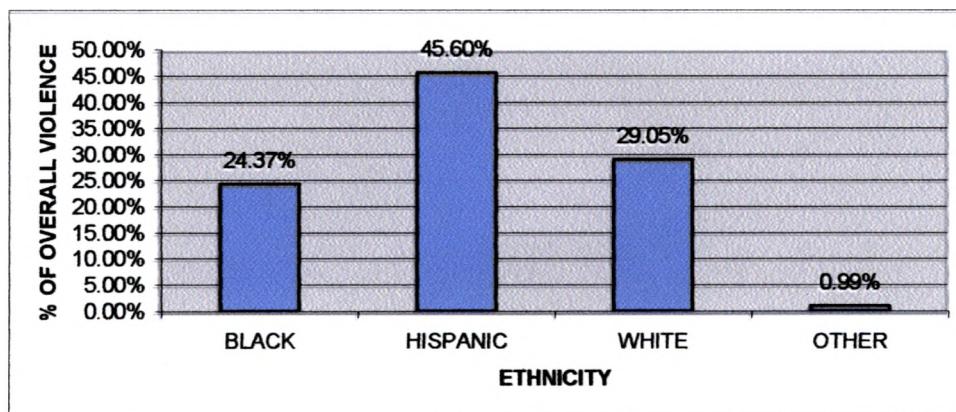

The third question analyzed using statistical (regression) analysis was to identify the variables that have relationship with school violence in a school district. This problem was addressed with sub-problems: 1). Is gender related to the rate of school violence in Texas public school district? 2). Is race or ethnicity related to the rate of school violence in a district? 3. Is grade level related with the rate of school violence in Texas public school district? This study proved that ethnicity, and grade level variables have relationship with the rate of school violence in a school district using regression model. A statistical significance was not established in the case of whether there is relationship between gender and school violence in Texas public school district. However, the data show that male students are more than twice likely to be referred to alternative education program than their female counterpart. This difference begins to diminish as the enrolment increases. Across the state, there were 1,010,889 reported incidents of overall

violence involving male students in grade six through twelve whereas 432,055 cases involve female see appendix B (detailed data of violence and its distribution).

Race or ethnicity is related to school violence in a district as revealed with the regression model above. Ironically, one way to look at this is that the more diverse a district is, the more referral to alternative education program or school district violence is reported. Statewide, a simple chart on ethnicity (chart 1) shows that non-white students account for over 81% of all referral to DAEP. Much could also be said about the fact that African-Americans are twice more likely to be referred relative to their percentage in the general population. In all, the non-white races are almost three times more likely to be sent to alternative education program (see chart 1) than the white race.

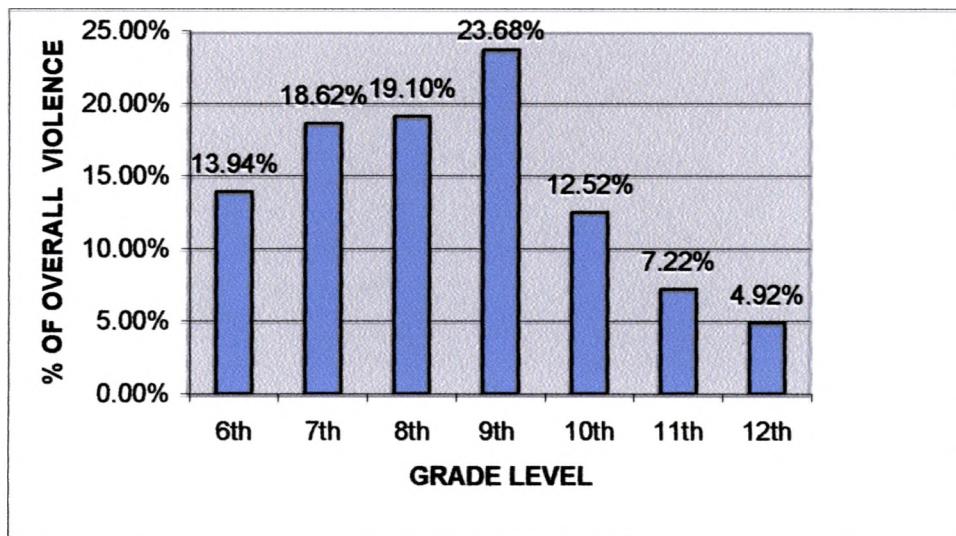

Chart 1. Comparing Ethnicity and Overall School Violence.

The relationship between grade level and school violence in Texas public school district was examined as well using regression model. Grade level is related with school violence in Texas public school district. There is strong presence of school violence in middle school, this peaks early in high school (ninth grade), then declines sharply from tenth grade onwards. Chart 2 tells the story by comparing grade level to overall school violence statewide. The incident reports show that at sixth grade, the middle school is

already reporting 13.94% of all school district's violations. This proportion is more than any reported in high school except for ninth grade which recorded 23.68% incidences. In 2003, the middle school reported a total of 51.66% of incidences reported in the state of Texas compared to 48.34% reported for high school grades combined.

Chart 2. Comparing Grade Level and Overall School Violence.

Given the aforementioned evidences, this study affirms that there are more violence hotspots in suburban and rural school districts in Texas public school system than there are in the urban school districts. It has been demonstrated that misdemeanor violations represent major problem for all school districts in Texas. This study also found that while felony violations are not major problem in Texas public school system, it represents higher proportion of all violations reported by non-urban school districts.

Policy Implications

The results of this study may inspire planners and school superintendents to order a more comprehensive research on school violence, the result of which may influence the allocation of more safe school funding to the suburban and rural school districts in addition to continuing funding of urban school districts

The Department of Public Safety may be inspired to use improved data to conduct an in-depth analysis of school violence, which may result in efficient use of their scarce resources such as deploying more officers where they will be effective in reducing school violence. Maps of school violence may also help to identify the location and distribution of felony incidents and disrupt future incidences before they happen (Crowe 2000; Hirschfield, Bowers and Yarwood 2001).

The implication of this analysis is that with further research, more resources for prevention, intervention and control efforts may be directed toward suburban and rural school districts.

Contribution to the Literature

This investigation presents a different application of ArcGIS spatial statistics. Other studies use juvenile crime statistics data and extend it to school age crimes, while this study has examined school district violence report based on incidences occurring on school ground and perpetrated by students enrolled in grade six through twelve. It also extends crime mapping to the study of incidences of violence on school properties.

Displaying incidents of school violence in a geographical context using spatial statistical analysis tools, complement the existing practices.

Future Directions for Research

For future study, it will provide more insights to conduct school violence investigation using disaggregate data. By disaggregate data this researcher means school violence reported for schools rather than school districts. The strength of crime analysis is in individual crime event (point data); at census block (or in this case school district) level many generalizations are not possible due to the scale. Another future challenge is to find out what kinds of students are being sent to DAEP. Are they from single parent home, abused or neglected children? The more is known about these children, the easier it will be to prevent them from getting into trouble in the first place. Finally, separate (or disciplinary alternative education) program is not the same as regular school program and most importantly, children cannot learn if they cannot attend school.

Recommendations

There have been numerous recommendations and actions to combat school violence; all these efforts must continue both at Federal and State levels. However, this research has shown that constant review of those efforts is necessary to ensure that resources get to where they will be most effective. It has been shown in this study that based on districts' reported violence data, school violence does not discriminate between urban and non-urban school districts. The recommendation listed below is not to substitute current efforts intended to curbing school violence. These are suggestions, based on practical experience, which every individual district can implement quickly at relatively little or no cost to begin to redirect behavior that may lead to school violence.

- There must be a concerted effort to have a uniform enforcement of school code of conduct in every school district (urban or not). Students should be able to

accurately predict the consequences of their actions. When a student makes a wrong choice, the actions taken (particularly at middle school) should be reported to the parents. At this age parents are very influential on their children and must be enlisted in the fight against school violence. This study found a statistical relationship between grade level and school district violence. With middle school accounting for a total of 51.66% of incidences of school violence reported in the state of Texas in 2003, every attempt must be made to reduce middle school violence. Most importantly, a report must be filed with the Texas Education Agency as required by the law and there must be some consequences for districts not complying.

- A mandatory class for all incoming high school freshmen should be instituted. This class will be aimed at breaking the culture of violence some students may have developed at middle school. Of all violence incidences reported, 9th grade accounted for 23.68%. This is the highest rate of all the grades studied (see Chart 4). This class will be in the form of ethnics and citizenship. High school grades account for 48.34% of all reported incidences of school violence in grades six through twelve. This is crucial in non-urban school districts where felony (or serious crime) represents the larger proportion of school district violence (see Figure 13). Students, preferably teenagers in jail or on parole, may be invited as guest speakers during this class. This will also be an opportunity to communicate the expectations, district culture, student code of conduct and the acceptable behavior.

- Start school violence prevention program early in middle school. The 2003 PEIMS report shows that school district violence starts early in middle school and peaks in ninth grade. After freshman year (ninth grade), it starts downward trend. Early prevention may reduce school violence at middle school and prevent accumulation of middle school violence at ninth grade (see Chart 2).

O Joseph Maduneme was born in Onitsha, Nigeria, on June 5, 1959. He attended St. John's Primary school and Christ the King College. He received the degree of Bachelor of Architecture in May 1994 and Bachelor of Science in Construction Project Management in December 1994 both from Louisiana State University, Baton Rouge, Louisiana.

He was employed as production manager in New Mexico and in Dallas, Texas until 1998. He has been the owner and operator of "BOCAJ Design & Plans Services" since 1996. He took a teaching position at Cedar Park, where he teaches Computer Aided Drafting & Multimedia Animation, in 2001.

In June 2003, he was admitted to the graduate school at Texas State University-San Marcos, to study Geographic Information Science (GIS).

Permanent Address: PO Box 202053
Austin, Texas, 78720-2053

This thesis was typed by O Joseph Maduneme.
